Name _____
DOB _____

SCLEROTHERAPY PROCEDURE DAY

After check in you will be taken to your room, the nurse will review your history, measure your vital signs and complete the consent forms. Photographs of the affected area will be taken. You will be given a hospital gown or shorts to wear. After that you may be given a mild oral sedative such as Ativan or valium.

The affected limb will be painted with an antiseptic such as chlorhexidine and draped.

Using vein illuminating lights, your physician will insert a very tiny needle into the spider vein and inject the sclerosant Polidocanol (Asclera™). This process is repeated until the desired area is treated. Multiple areas may require additional treatment sessions. If the extent of veins needing treatment requires ≥ 10 ml maximum dose of Polidocanol per session, repeat treatments separated by 1 to 2 weeks may be necessary.

After the ablation compression with an elastic bandage or stocking is applied. You will be observed for 30 min after the procedure for possible severe (anaphylactic) allergic reaction.

The entire procedure takes around one hour.

Notes and Additional Orders:
